Homo sapiens EST sequence. This sequence was generated as part of
The Wellcome Trust Sanger Institute program to identify and
annotate genes in the human genome. Incomplete or unconfirmed genes
are experimentally analysed using a variety of cDNA ilbrary
resources. This sequence was obtained from a PCR product generated
from a pool of up to 100,000 cDNA clones derived from
pool_FLU_lib_v_SPC cDNA library. Further information can be found
                                                                                                                                                                                                                                                                                                                                                      /dlone=IMAGE:673350"

Sanger Centre name: sccdio816.400489A

Homo sapiens EST sequence. This sequence was generated as part of

The Wellcome Trust Sanger Institute program to identify and

annotate genes in the human qenome. Incomplete or unconfirmed genes

are experimentally analysed using a variety of cDNA library

resources. This sequence was obtained from a PCK product generated

from a pool of up to 100,000 cDNA clones derived from

pool AK lib v SPD cDNA library. Further information can be found at

http://www.sanger.ac.uk/Teams/Teams/Team69/.

Patent No. 5776696
GENERAL INFORMATION:
APPLICANT: SALOWE, SCOTT P.
TITLE OF INVENTION: A HIGH THROUGHPUT ASSAY USING
TITLE OF INVENTION: FUSION PROTEINS
NUMBER OF SEQUENCES:
ADDRESSEE: Merck & Co., Inc.
STREET: P.O. Box 2000, 126 E. Lincoln Ave.
                                                                                                                                                                                                                                                                                                                                                                                                                 Proteins

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New polypeptides for treating or preventing a disorder associated with them, in humans, e.g. cardiomyopathy, atherosclerosis or cancers.

Claim 3; Page 98; 263pp; English.

The invention relates to an isolated polypeptide (NOVX) a mature form of NOVX, a NOVX variant (differing by no more than 15%), the nucleotide encoding NOVX (or its complement, fragment or variant). NOVX is NOVI-14,

```
and antibody against it, are useful for treating or preventing (e.g. by an antibody against it, are useful for treating or preventing (e.g. by atheroscierosis, a Novx-associated disorder in humans, e.g. cardiomyopathy, atheroscierosis, a Misorder felaced to call signal processing and metabolic pathway modulation, diabetes or cancers. The Novx polypeptide metabolic pathway modulation, diabetes or cancers. The Novx polypeptide predisposition to the disease. The Novx nucleic acid and polypeptide are especially useful in therapeutic or prophylactic applications for cancers (e.g. adenocarcinoma, lymphoma, prostate cancer or uterus cancers), immune response, graft-versus-host disease, acquired cancer), immune response, graft-versus-host disease, hypertension, congenital heart defects, multiple sclerosis, inflammation or Albright herating the conditions. This is also useful in detection assays, creating the conditions. This is also useful in detection assays, chromosome mapping, issue typing, diagnostic or prognostic assays, or for developing a powerful assay system for functional analysis of various contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence represents a NOVX protein

```
The invention comprises the amino acid and coding sequences of modulator of antigen receptor signalling (MARS) proteins. The MARS protein is a putative tumour suppressor gene and exhibits structural and sequence similarity to the Scr-like adaptor protein (SLAP): The MARS DNA and protein sequences of the invention are useful for the treatment of myeloid malignancies (e.g. acute myelogenous leukaemia) autoimmune disorders, immunosuppression, myeloproliferative disorders and malignancies related to the de-regulation of tyrosine kinases (e.g. breast cancer). The present amino acid sequence represents a human MARS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DDICCLLKEPCVLQRAGPLPGKDIPLPVTVQRTPLNWKELDSSLLFSEAATGEBSLLSEG

The present sequence represents the human Src-like inhibitory molecule (SilM) protein (I). The present invention describes a SLIM protein comprising an N-terminal myristylation sequence, an N-terminal SH2 domain, and an N-terminal myristylation sequence, an N-terminal SH2 domain which can N-terminal SH2 domain which is unable to bind to CDI. (I) has antiinflammatory, immunosuppressive and anti-HIV activities, and can be used as a modulator of lymphocyte activation, and of ubiquitination of a CDI target protein and in gene therapy. (I) is useful for screening a bioactive agent capable of binding to SLIM. (I) is also useful for screening a bioactive agent capable of the streatment of conditions which involves this function or dysregulation of SLIM protein activity, is useful in the study or in the treatment of conditions which involves this function or dysregulation of SLIM protein activity, is to diagnose, treat or dysregulation of SLIM protein activity, is to diagnose, treat or prevent SLIM associated disorders. (I) or the polynuclectide encoding it (II) is useful for modulating and activation in lymphocytes and/or platelet activation, for modulating and activation in lymphocytes and/or planelocytes. (I) or is also useful in the treatment of immunodeficiency disorders, such as acquired immunodeficiency syndrome (AIDS), for the prevention and treatment of acute inflammatory disorders, chronic inflammatory activation and transplant rejection
                                                                                                                                                                                                                                                              New src-like inhibitory molecule protein, useful for treating immunodeficiency disorders and inflammatory disorders, comprises N-terminal myristylation sequence, SH2 domain and/or SH3 domain.
                                                                                                                                    C, Fu AC,

Novel substantially purified human SH2/SH3-domain-containing adapter polypeptide, termed Src-Like Adapter Protein-2, useful for therapeutic intervention in immunological and inflammatory disorders and cancer.

Claim 9; Fig 2; 85pp; English.

The invention relates to a substantially purified human SH2/SH3-domain-containing adapter polypeptide, termed Src-like Adapter Protein-2 (SLAP-2). The invention is useful for treating an immune disorder involving hyperactivity of B- or T-lymphocytes in a mammal. The invention is useful for screening for antagonists or inhibitors of the interaction of histap-2 with cellular signalling compounds, for disponsing, treating or preventing diseases or disorders associated with aberrant or uncontrolled collular signal transduction, for determining those cellular signalling molecules which associate with hSLAP-2 and which provide critical signals for cell activation, and as effectors in methods to affect T-cell activation. The invention is useful in screening assays to identity and detect candidate bloactive agents that modulare hSLAP-2 biocactivity, for potential use to treat autoimmune diseases which may be caused by hyperactivated B cells, as well as to treat diseases which may be caused by hyperactivated T cells, in addition to other immune system related conditions, diseases, or disorders, T-cell and B-cell neoplasms, inflammation disorders, diseases and conditions, rheumatoid arthritis, ostecarthritis, psoriasis, rhinitis, inflammatory bowel disease (Crohn's CURA-) CURAGEN CORP.

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX completes are extracted as: cytostatic; hepatotropic; vulnerary; antipartise such as: cytostatic; hepatotropic; vulnerary; antipartise; antipartise such as: cytostatic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; or cardiant; thrombolytic; coagulant; vasotropic; anticibatic; hypotensive; dermatological; antifungal; antirhymosit; antibacterial; antiviral; antifungal; antirheumatic; antithymoid; and antianemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an OREX-associated disorder. The nucleic acids can be used to express OREX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders osteoarthritis, graft vs host disease, cardiovascular disease, disorders mellitus, hypertension, hopethyroidism, cholesterol ester storage, systemic lupus erythematoaus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allargies, aplastic ansemia, burns, wounds, hone and cartilage damage, nocturnal haemoglobinuria, antiliflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            134
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      194

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             59
                                                                                                                                                                                                                                                                                                  The invention comprises the amino acid and coding sequences of modulator of antigen receptor signalling (MARS) proteins. The MARS protein is a putative tumours suppressor gene and exhibits structural and sequence similarity to the Sor-like adaptor protein (SLAP). The MARS DNA and protein sequences of the invention are useful for the treatment of myeloid malignancies (e.g. acute myelogenous leukaemia) autoimmune disorders, immunosuppression, myelogenoliferative disorders and malignancies related to the de-regulation of tyrosine kinases (e.g. breast cancer). The present amino acid sequence represents a mouse MARS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises the amino acid and coding sequences of modulator of antigen receptor signalling (MARS) proteins. The MARS protein is a putative tumour suppressor gene and exhibits structural and sequence similarity to the Scr-like adaptor protein (SLAP). The MARS DNA and protein sequences of the invention are useful for the treatment of myeloid malignancies (e.g. acute myelogenous leukaemia) autoimmune disorders, immunosuppression, myeloproliferative disorders and malignancies related to the de-regulation of tyrosine kinases (e.g. breast cancer). The present amino acid sequence represents a mouse MARS
                               tumour suppressor gene; Scr-like adaptor protein; SLAP; myeloid malignancy; acute myelogenous leukaemia; autoimmune disorder; immunosuppression; myeloproliferative disorder; breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 MGSLPSRRKSLPSPSLSSSVQGQGPVTMRABRSKATAVALGSFPAGGPAELSLRLGEPLT

The present invention relates to novel human coding sequences (ABO99268-ABO9608) and proteins (ABP64682-ABP65022). The sequences are useful in the research methods. The polynucleotides may be used in the field of molecular biology as hybridisation probes, primers for PCR, for chromosome and gene mapping, for the recombinant production of protein, or in generation of anti-sense DNA or RNA. The colynucleotides are useful in diagnostics as expressed sequence tags (ESTS) for identifying expressed genes or for physical mapping of the numan agnome. The proteins may be used as molecular weight markers, or as nutritional sources or supplements. The proteins may be used to maintain and expand cell population in a totipotential or pluripotential state useful for re-engineering damaged or diseased tissues, transplantation, manufacture of bio-pharmaceuticals or the development of bio-sensors. The polynucleotides and proteins are useful for preventing, treating or ameliorating disorders involving aberrant protein expression or biological activity, e.g. haematopoidetic disorders, central/peripheral nervous system diseases, mechanical and traumatic disorders, allergic viral, bacterial or fungal infection, autodimmne disorders, allergic reactions and conditions, coagulation were assembled from ESTS collated mainly by sequence of the invention will be seminated from one or more public databases. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

The sequences were discovered in human atherogenic cells, in particular in platelets and human umbilical vein endothelial cells (HUVEC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX-associated disorder, e.g. cancer, cardiovascular disease, allergy, autoimmune disease, wound healing, blood socgulation disorders or inflammatory disorders. Note: The sequence data for this patent did not form part of the printed specification, but was sequated uspto.gov/sequence.html?DocID=20020082206

The present invention describes the human Src-like inhibitory molecule (SLIM) protein (I). The present invention describes a SLIM protein (C comprising an N-terminal myristylation sequence, an N-terminal SH3 domain which can bind to Cb1, or comprising an N-terminal SH3 domain which can bind to Cb1, or comprising an N-terminal SH3 domain which can bind to Cb1, or comprising an N-terminal SH2 domain which co is unable to bind to Cb1. (I) has antifilfammancory, immunosuppressive and can the transport of lymphocyte activation, and of ubiquitination of a Cb1 target protein, and in gene cherapy. (I) is useful for screening a bioactive agent capable of binding Ct os SLIM. (I) is also useful for screening a bioactive agent capable of modulating SIIM binding. (I) or its fragments is useful in the study or cyprevent SIIM associated disorders. (I) or the polymorleotide encoding it (II) is useful for modulating alwocyte and/or platelet activation, for modulating and activation in modulating and activation in lenkocyte and/or platelets and for modulating and activation in lenkocyte and/or mast cells. (I) or is also useful for modulating the basal activity of lymphocytes. (I) is useful in the treatment of immunodeficiency disorders, such as
                                                                                                                                              Human, Src-like inhibitory molecule, SLIM, Src-like adapter protein, SLAP, inhibitor; antinflammatory, immunosuppressive; anti-HIV, modulator; lymphocyte, CDl, gene therapy; immunodeficiency disorder, acquired immune deficiency sydacome; AIDS, actte inflammatory disorder; chronic inflammatory disorder; autoimmune disorder; rejection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Luo Y;

```

The present invention relates to novel human ORFX polypeptides and their coding sequences (ABPG5611-ABPG4681 and ABC98194-ABD99267). The sequences were discovered in human atherogenic cells, in particular in platelets and human umbilical vein endothelial cells (HVVBC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX-associated disorder, e.g. cancer, cardiovascular disease, allergy, autoimmune disease, wound healing, blood for this pater of form pater of the printed specification, but was sequated in electronic format directly from the USPTO web site at sequence.html?DocID=20020082206

anergy or apoptosis in the T cells and antigen presenting cells (APCS). Also included are a mammalian cell useful in the treatment of cancer where the receptor which binds tumour associated lipids and induces cellular inactivation or death is deleted or functionally deactivated, producing (INI) a tumouricidal immunocyte population in vivo in a mammal control of allowing tumour associated lipids to context immunocytes in which receptors for immunosuppressive facty acids, ceramides, glycolipids, glycosphingolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, libopeptides and proteoglycolipids, gangliosides, simplated glycoms, libopeptides and proteoglycolipids are inactivated or uncertaint to the treatment of cancer (where m adaptor protein which inhibite I cell activated), a composition useful in the treatment of cancer (comprising a lipid raft conjugated to a superantigen) protein which cancer (comprising a lipid raft conjugated to a superantigen) protein which inhibit a curvated immunocyte population as vivo in a mammal (by a tumouricidal immunocyte population, and administering the tumouricidal lipids to context APCS, in which receptors for the tumour associated lipids to context APCS, in which receptors for the tumouricidal lipids are inactivated or deleted to produce a tumouricidal lipids are inactivated or deleted to produce a tumouricidal induced population activated immunocytes to the host), producing a tumour associated lipids to context APCS, in which reappores for the tumouricidally activated or deleted to produce a tumouricidally activated or functionally deartivated to produce a tumouricidally activated or functionally deartivated to produce a tumouricidally activated or context or produce a tumouricidally activated or colls to be host, or allowing a superanticidally activated or colls to be the host, or allowing a superanticidally activated or colls to produce a tumouricidally activated or cells to be the host, or tumouricidal or cell population in vivo in a mammal (by administ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 tumours. Bacterial superantigens are co-administered or administered as fusion constructs with anti-tumour proteins or motifs. The present sequence represents a tumour antigen or a motif identifying a tumour antigen, which can be functionally deactivated in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    241

The invention relates to a novel method for identifying a compound that modulates T lymphocyte activation. The method comprises contacting a T cell comprising an A-raf-1 or TCPTP/PPTN2 polypeptide with a compound, where the A-raf-1 or TCPTP/PPTN2 polypeptide his a compound, where the A-raf-1 or TCPTP/PPTN2 polypeptide by a mucleic acid that hybridises to a nucleic acid encoding a polypeptide having a sequence selected from two 606-amino acid sequence and a 415-amino acid sequence given in the specification. The method of the invention has immunosuppressive, antiasthmatic, antiallergic, and antiinflammatory activity. The method is useful for identifying compounds that modulate lymphocyte activation and migration, and for monitoring changes in cell surface marker expression, cytokine production, antibody production, surface marker expression, cytokine production, antibody production, corpilaraty cells. The A-raf-1 or TCPTP/PTN2 proteins may be used as drug targets for compounds that suppress or activate lymphocyte activation and migration, eag. for the treatment of diseases in which modulation of the immune response is desired such as delayed type hypersensitivity reactions, athima, allergies, graft versus host disease, and activated for treatmng disorders related T and B cell activation and migration early sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying a compound that modulates T lymphocyte activation, useful for monitoring changes in cell surface marker expression, comprises contacting a T cell comprising an A-raf-1 or TCPTP/PTPN2 polypeptide with

                                                                                ABR59698;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chu P,
RESULT 13
                     ABR59698
```

```
The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and artagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tenden and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias.

AMUS9510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention

coding sequences (ABP63631-ABP64681 and ABQ98194-ABU992e). The sequence were discovered in human atherogenic cells, in particular in platelets and human umbilical vein endothelial cells (HVWEC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX associated disorder, e.g. cancer, actdiovascular disease, allergy, autoimmune disease, wound healing, bloo coagulation disorders or inflammatory disorders. Note: The sequence data for this patent did not form part of the printed specification, but was sequence in electronic format directly from the USPTO web site at sequence.html?DocID=20020082206

"Supeription: catalyzes the phosphorylation of a peptidyl tyrosine residue by ATP G. Superfamily: protein-tyrosine kinase src; protein kinase homology; SH2 homology; SH3 hc C. Superfamily: protein-tyrosine kinase src; protein kinase homology; SH2 homology; SH3 hc C. Severates: ATP; autophosphorylation; blocked amino end; lipoprotein; myristylation; phos F; 2-505/Product: protein-tyrosine kinase hck #status predicted «NAT» P; 2-505/Product: protein-tyrosine kinase hck #status predicted «NAT» P; 213-220/Domain: SH3 homology «SH3» P; 213-220/Domain: protein kinase homology «KIN» P; 213-2497/Domain: protein kinase ATP-binding motif P; 247-255/Region: protein kinase ATP-binding motif P; 25/Region: protein kinase ATP-binding motif P; 25/Region: protein kinase ATP-binding motif F; 25/Region: protein kinase ATP-binding motif F; 25/Region: protein kinase ATP-binding motif F; 25/Region: myristylated amino end (Gly) (in mature form) #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Active site: Lyg #status predicted F; 25/26%/Ac

Tonoteln-2 (SLAP-2), which negatively regulates T cell receptor

T signaling.";

J. Biol. Chem. 277:19131-19138 (2002)

- PUNCTION: Adapter protein, which negatively regulates T-cell

receptor (TCR) signaling. Inhibits T-cell antigen-receptor induced activation of nuclear factor of activated T-cells. May act by

linking signaling proteins such as ZAP70 with CBL, leading to a climital along signaling proteins.

- SUBUNIT: Interacts with phosphorylated proteins ZAP70 and CD3Z via its SH2 domain (By similarity). Interacts with phosphorylated CBL

- SUBCELLULAR LOCATION: Cytoplesmic. Isoform I is localized to the endosomal vesicles, including late endosomal vesicles. including late endosomal vesicles. Isoform 2 may be cytoplasmic and is not Hammond S., Harley J.L., Heath P.D., Ho S., Holden J.L., Howden P.J.,
